DM collider searches

Dark matter (DM) searches at colliders

Social dark matter

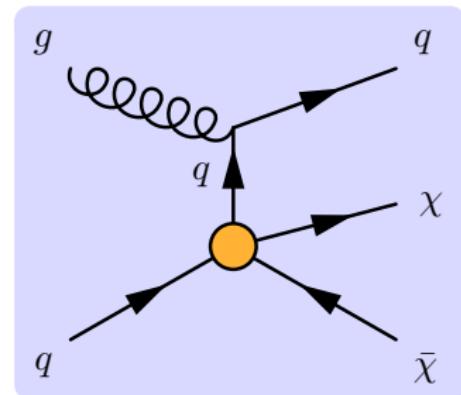

Accompanied by other new particles

Complicated decay chains

Decay products of other particles

Various final states

(jets + leptons + \cancel{E}_T , ...)

Maverick dark matter

DM particle is the only new particle
reachable at the collision energy

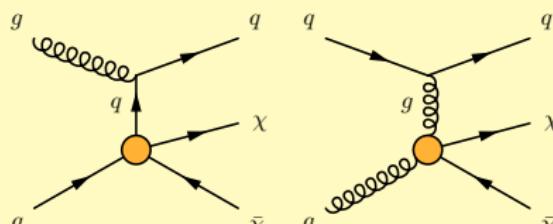

Direct production

Mono-X + \cancel{E}_T final states

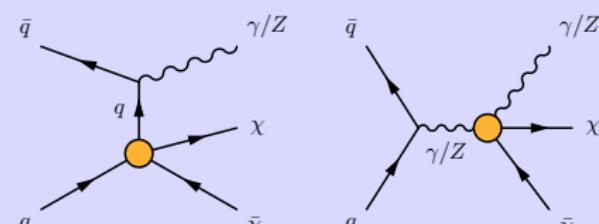

(monojet, mono- γ , mono-W/Z, ...)

(From Rocky Kolb's talk)

DM direct productions at hadron colliders

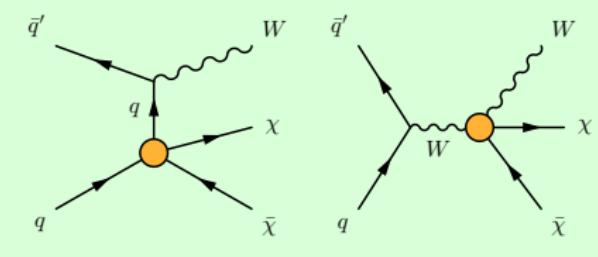

Monojet + \cancel{E}_T

Monophoton/mono-Z + \cancel{E}_T

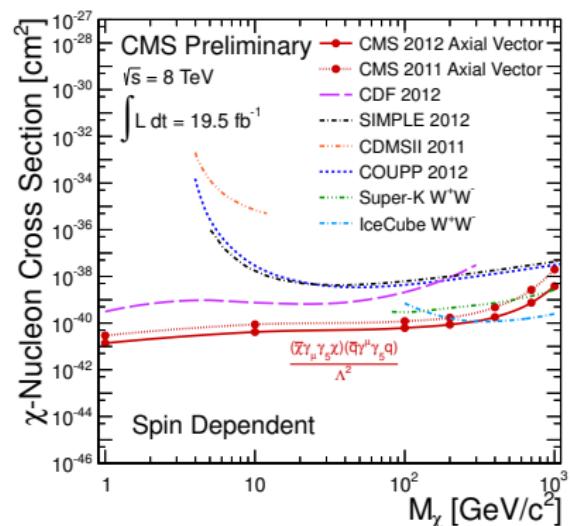

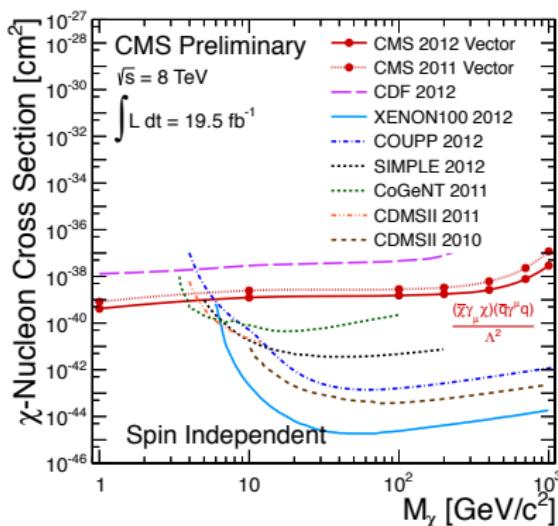

Sensitive to the DM couplings to
quarks, gluons
photons, Z bosons
 W^\pm bosons

Mono-W + \cancel{E}_T

Hadron colliders

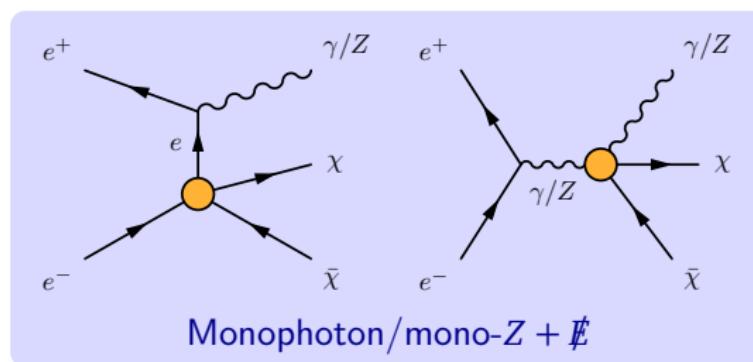

LHC vs. direct detection

Constraints on DM-nucleon scattering cross section given by the CMS dark matter search in the monojet + \cancel{E}_T final state with an integrated luminosity of $\sim 20 \text{ fb}^{-1}$ at $\sqrt{s} = 8 \text{ TeV}$.

[CMS PAS EXO-12-048]

Lepton colliders

DM direct productions at e^+e^- colliders

Sensitive to
the DM couplings to
electrons/positrons
photons
Z bosons

Collision energies of future e^+e^- colliders:

$\sqrt{s} = 250$ GeV: "Higgs factory" (**CEPC/TLEP, ILC**)

$\sqrt{s} = 500$ GeV: typical **ILC**

$\sqrt{s} = 1$ TeV: upgraded **ILC** & initial **CLIC**

$\sqrt{s} = 3$ TeV: ultimate **CLIC**

Lepton colliders

MC simulation

Simulation tools:

FeynRules (adding new particles & couplings)

MadGraph (parton-level calculation & sample generation)

PYTHIA (parton shower & hadronization)

PGS (jet clustering & fast detector simulation)

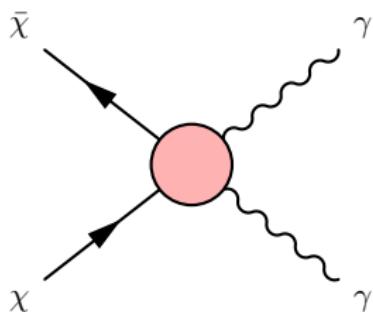

SiD/ILD-like detector:

$$\text{ECAL energy resolution } \frac{\Delta E}{E} = \frac{17\%}{\sqrt{E/\text{GeV}}} \oplus 1\%$$

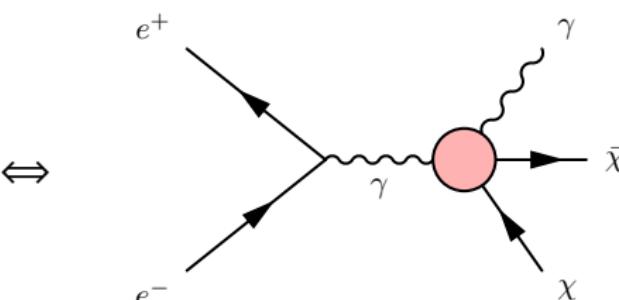

$$\text{HCAL energy resolution } \frac{\Delta E}{E} = \frac{30\%}{\sqrt{E/\text{GeV}}}$$

Monophoton signature

DM-photon interaction

$$\chi\bar{\chi} \rightarrow \gamma\gamma$$

Indirect search γ -ray line signature

$$e^+ e^- \rightarrow \chi\bar{\chi}\gamma$$

Collider searchMonophoton signature ($\gamma + \not{E}$)

Monophoton signature

Effective operator approach

If DM particles couple to photons via exchanging some mediators which are **sufficiently heavy**, the DM-photon coupling can be approximately described by **effective contact operators**.

For Dirac fermionic DM, consider $\mathcal{O}_F = \frac{1}{\Lambda^3} \bar{\chi} i\gamma_5 \chi F_{\mu\nu} \tilde{F}^{\mu\nu}$:

$$\langle \sigma_{\text{ann}} v \rangle_{\chi\bar{\chi} \rightarrow 2\gamma} \simeq \frac{4m_\chi^4}{\pi\Lambda^6}, \quad \sigma(e^+e^- \rightarrow \chi\bar{\chi}\gamma) \sim \frac{s^2}{\Lambda^6}$$

For complex scalar DM, consider $\mathcal{O}_S = \frac{1}{\Lambda^2} \chi^* \chi F_{\mu\nu} F^{\mu\nu}$:

$$\langle \sigma_{\text{ann}} v \rangle_{\chi\chi^* \rightarrow 2\gamma} \simeq \frac{2m_\chi^2}{\pi\Lambda^4}, \quad \sigma(e^+e^- \rightarrow \chi\chi^*\gamma) \sim \frac{s}{\Lambda^4}$$

In the $\gamma + \cancel{E}$ searching channel, the main background is $e^+e^- \rightarrow \nu\bar{\nu}\gamma$. Minor backgrounds are $e^+e^- \rightarrow e^+e^-\gamma$, $e^+e^- \rightarrow \tau^+\tau^-\gamma$, ...

Sensitivity

3σ sensitivity

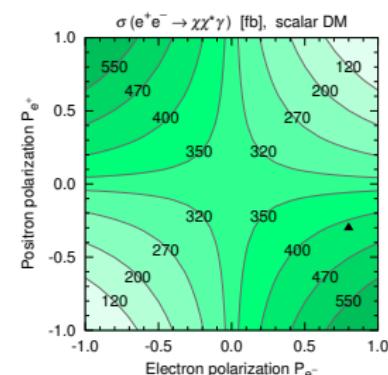

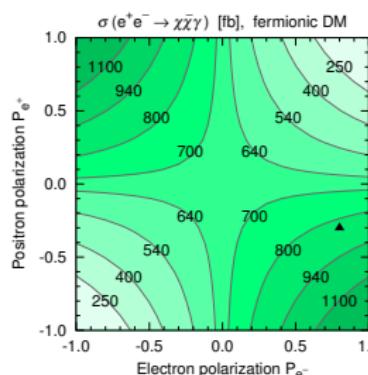

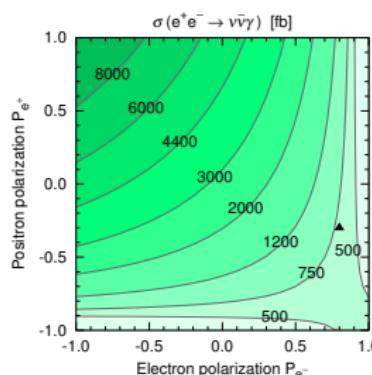

Solid lines: 100 fb^{-1} ; dot-dashed lines: 1000 fb^{-1} ($S/\sqrt{B} = 3$)

Beam polarization

Beam polarization

For a process at an e^+e^- collider with **polarized beams**,

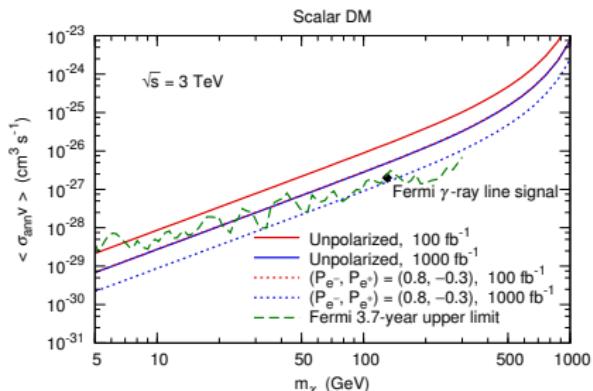

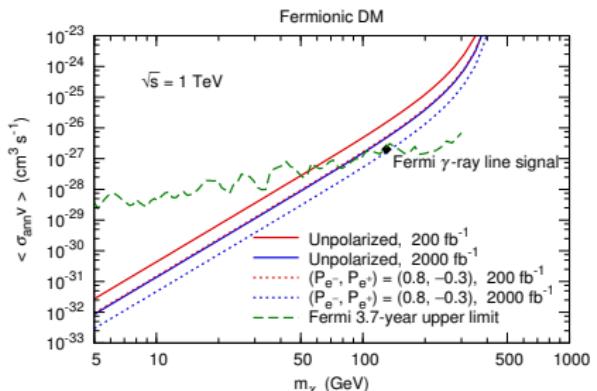

$$\sigma(P_{e^-}, P_{e^+}) = \frac{1}{4} \left[(1 + P_{e^-})(1 + P_{e^+})\sigma_{RR} + (1 - P_{e^-})(1 - P_{e^+})\sigma_{LL} \right. \\ \left. + (1 + P_{e^-})(1 - P_{e^+})\sigma_{RL} + (1 - P_{e^-})(1 + P_{e^+})\sigma_{LR} \right]$$

$\blacktriangle (P_{e^-}, P_{e^+}) = (0.8, -0.3)$ can be achieved at the ILC

[ILC technical design report, Vol. 1, 1306.6327]

Beam polarization

$$(S/\sqrt{B} = 3)$$

Using the **polarized beams** is roughly equivalent to **increasing** the integrated luminosity by **an order of magnitude**.

For fermionic DM (scalar DM), a data set of 2000 fb^{-1} (1000 fb^{-1}) would be just sufficient to test the potential Fermi γ -ray line signal at an e^+e^- collider with $\sqrt{s} = 1 \text{ TeV}$ (3 TeV).

Mono-Z signature

Mono-Z signature: DM couplings to ZZ/Z γ

The mono-Z channel at high energy e^+e^- collider can be sensitive to **the DM coupling to ZZ/Z γ .**

Assuming the DM particle χ is a Dirac fermion, we consider the following effective operators:

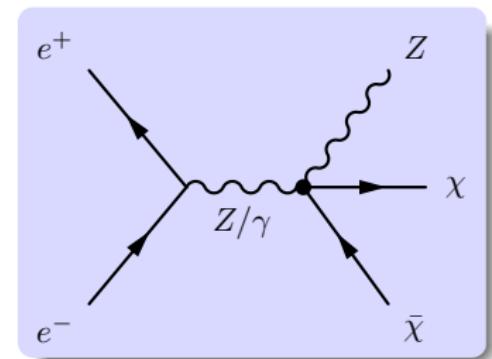

$$\mathcal{O}_{F1} = \frac{1}{\Lambda_1^3} \bar{\chi} \chi B_{\mu\nu} B^{\mu\nu} + \frac{1}{\Lambda_2^3} \bar{\chi} \chi W_{\mu\nu}^a W^{a\mu\nu}$$

$$\supset \bar{\chi} \chi (G_{ZZ} Z_{\mu\nu} Z^{\mu\nu} + G_{AZ} A_{\mu\nu} Z^{\mu\nu})$$

$$\mathcal{O}_{F2} = \frac{1}{\Lambda_1^3} \bar{\chi} i \gamma_5 \chi B_{\mu\nu} \tilde{B}^{\mu\nu} + \frac{1}{\Lambda_2^3} \bar{\chi} i \gamma_5 \chi W_{\mu\nu}^a \tilde{W}^{a\mu\nu}$$

$$\supset \bar{\chi} i \gamma_5 \chi (G_{ZZ} Z_{\mu\nu} \tilde{Z}^{\mu\nu} + G_{AZ} A_{\mu\nu} \tilde{Z}^{\mu\nu})$$

$$\mathcal{O}_{FH} = \frac{1}{\Lambda^3} \bar{\chi} \chi (D_\mu H)^\dagger D_\mu H \rightarrow \frac{m_Z^2}{2\Lambda^3} \bar{\chi} \chi Z_\mu Z^\mu$$

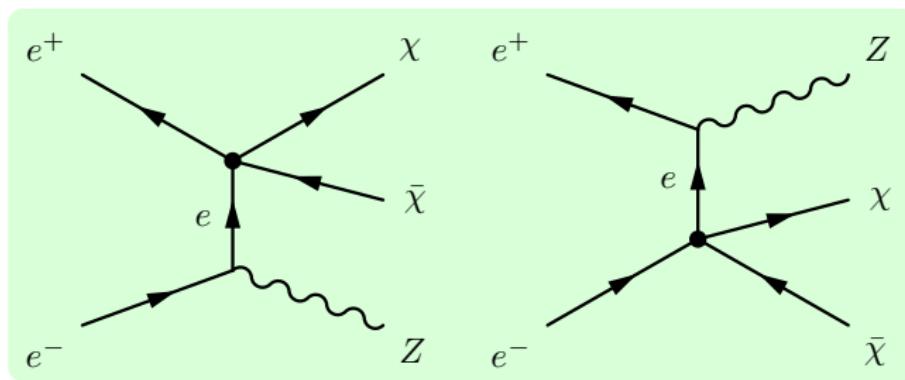

$$G_{ZZ} \equiv \frac{\sin^2 \theta_W}{\Lambda_1^3} + \frac{\cos^2 \theta_W}{\Lambda_2^3}$$

$$G_{AZ} \equiv 2 \sin \theta_W \cos \theta_W \left(\frac{1}{\Lambda_2^3} - \frac{1}{\Lambda_1^3} \right)$$

Mono-Z signature

Mono-Z signature: DM couplings to e^+e^-

This channel can also be sensitive to **the DM coupling to e^+e^- .**

We consider the following effective operators:

$$\mathcal{O}_{\text{FP}} = \frac{1}{\Lambda^2} \bar{\chi} \gamma_5 \chi \bar{e} \gamma_5 e, \quad \mathcal{O}_{\text{FA}} = \frac{1}{\Lambda^2} \bar{\chi} \gamma^\mu \gamma_5 \chi \bar{e} \gamma_\mu \gamma_5 e$$

Sensitivity

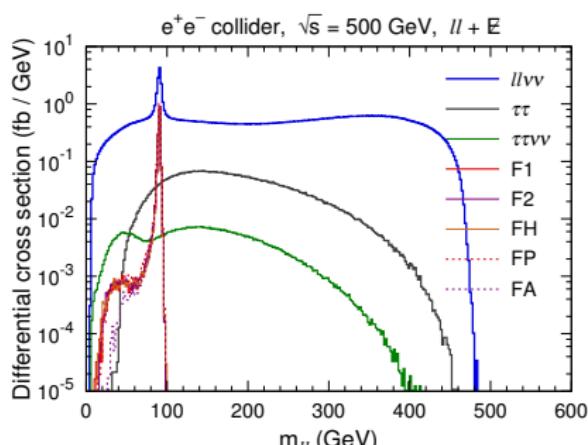

Lepton channel: $Z \rightarrow \ell^+ \ell^- (\ell = e, \mu)$ **SM backgrounds:** $e^+ e^- \rightarrow \ell^+ \ell^- \bar{\nu} \nu$, $e^+ e^- \rightarrow \tau^+ \tau^-$, $e^+ e^- \rightarrow \tau^+ \tau^- \bar{\nu} \nu$

\mathcal{O}_{FH}	13.5	24.8	1.84
\mathcal{O}_{FP}	18.7	34.4	1.84
\mathcal{O}_{FA}	12.3	23.0	1.87

Conclusions and discussions

- ① In addition to DM direct and indirect detection, DM searches at colliders provide **an independent and complementary way** to explore the microscopic nature of DM particles.
- ② The monophoton searching channel at e^+e^- colliders is sensitive to **the DM couplings to $\gamma\gamma$** .
- ③ The mono-Z searching channel at e^+e^- colliders is sensitive to **the DM couplings to $ZZ/Z\gamma$ and to e^+e^-** .
- ④ **Polarized beams** are helpful to improve the signal significance.

Mono-Z: e^+e^- colliders vs. LHC

LHC, $\sqrt{s} = 8 \text{ TeV}, 20.3 \text{ fb}^{-1}$
 [ATLAS, arXiv:1404.0051]

DM couplings to e^+e^- : mono-Z vs. monophoton

[Chae and Perelstein, arXiv:1211.4008]

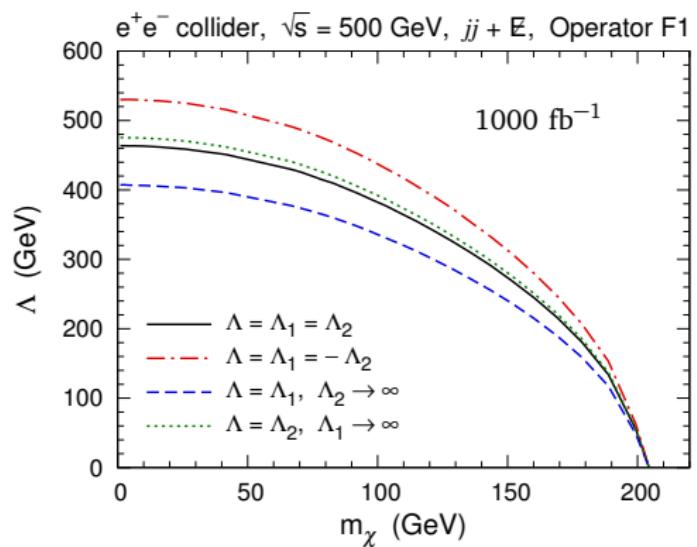

3σ sensitivity affected by the Λ_1 - Λ_2 relation

$\chi\chi ZZ$ coupling:

$$G_{ZZ} = \frac{\sin^2 \theta_W}{\Lambda_1^3} + \frac{\cos^2 \theta_W}{\Lambda_2^3}$$

$\chi\chi\gamma Z$ coupling:

$$G_{AZ} = 2 \sin \theta_W \cos \theta_W \left(\frac{1}{\Lambda_2^3} - \frac{1}{\Lambda_1^3} \right)$$

$\Lambda = \Lambda_1 = \Lambda_2$: only the $\chi\chi ZZ$ coupling contributes.

$\Lambda = \Lambda_1 = -\Lambda_2$: the $\chi\chi\gamma Z$ coupling is dominant.

$\Lambda = \Lambda_1, \Lambda_2 \rightarrow \infty$: the $\chi\chi\gamma Z$ coupling is dominant.

$\Lambda = \Lambda_2, \Lambda_1 \rightarrow \infty$: the $\chi\chi ZZ$ and the $\chi\chi\gamma Z$ couplings are comparable.

Chiral couplings in the standard model

- W^\pm only couples to left-handed e^- (right-handed e^+).
- e^\pm couples to Z^0 via $\frac{g_2}{2\cos\theta_W}(g_L \bar{e}_L \gamma^\mu e_L + g_R \bar{e}_R \gamma^\mu e_R) Z_\mu$.
 $g_L = -1 + 2\sin^2\theta_W \simeq -0.56$, $g_R = 2\sin^2\theta_W \simeq 0.44$, $g_L^2/g_R^2 \simeq 1.56$.
The left-handed e^- (right-handed e^+) coupling to Z^0 is stronger.
